Nearly five years of full-stack work on the in-house platform a title and escrow company runs on: Python, Flask and PostgreSQL on the back end, Vue 3 and TypeScript on the front end. I want to know why things work, and I keep my tools and dependencies current.

Experience

Web Developer | **Settlor** — **Dec 2021** to present

A title insurance and escrow company that runs on its own software: an internal operations platform for title, closing, escrow accounting and e-recording, client portals for lenders and agents, and a public API.

- Led a cross-repo upgrade to Python 3.14 on new Debian base images in 2026: got the code ready for SQLAlchemy 2.0, moved to Node 24, pinned exact dependency versions and gated image builds on vulnerability scans. About 650 commits across about 23 repositories.
- Built a remote print service end to end, as its only developer: a Windows service at office sites that takes print jobs from the cloud app and drives local printers over IPP, with a job queue, retries, a web admin page and a signed installer.
- The largest single contributor to the in-house Vue 3 design system, with about 400 of about 1,300 commits, and to moving screens off Vue 2.
- Built FastAPI endpoints for the public API, led the move to Pydantic v2-native schemas, and rolled out type checking with ty, advisory first and then blocking.

Back End Software Engineer | **Fairwinds Ops** — **Sep 2021** to **Nov 2021**

Built Go features for the Insights product.

Line Cook | **Bluegrass Lounge** — **Sep 2020** to **May 2021**

Sous Chef | **Blake Street Tavern** — **Jan 2019** to **Feb 2021**

Ran food prep, wrote procedures, trained staff and managed inventory.

Software Engineer | **ShipOffers** — **Mar 2015** to **Oct 2016**

Built Ruby on Rails features for an order management system, plus daily accounting reports.

Hospital Corpsman | **United States Navy** — **Feb 2010** to **Feb 2015**

Gave emergency, standard and routine medical treatment to service members.

Project

tagshelf

Go, for Windows and Linux, since Oct 2026

Sorts audio files into a music library by their tags. It sets identical copies aside instead of deleting them, and records every move so a run can be undone.

- A CLI for runs, and a terminal UI for the files that need a person: fixing tags, MusicBrainz lookups, choosing which duplicate to keep.
- Static builds for Windows (amd64) and Linux (amd64 and arm64) that need no C library, with CI on GitHub and checksummed releases.
- Does a dry run first, never deletes an audio file, and migrates its own database on upgrade, keeping a backup of the old one.

Skills

Languages Python, TypeScript, Go

Back end Flask, FastAPI, Pydantic v2, SQLAlchemy, Alembic, PostgreSQL, Celery, Redis, WebSockets

Front end Vue 3, Vite, Pinia, Storybook

Testing pytest, Vitest, Playwright

Infrastructure Docker, Kubernetes, Helm, GitHub Actions, Google Cloud

Education

Back-End Engineering

Turing School of Software & Design

Feb 2021 to **Oct 2021**

Student Leadership Committee Representative and Black at Turing Representative.
